Project Presentation and Final Delivery

Overview

Topic: Project Presentation and Final Delivery

Due date: Presentation dates are announced via Canvas announcement. The project report is due Friday after the final exam period.

Submission:

The final project will be graded on the basis of an in-class presentation, a written final report where the GitHub link should be included to show your complete and executable code. This page describes each of these components and gives a grading rubric for each. Each component contributes to the project in the following amounts:

- 35% - in-class presentation
- 40% - written report (code is counted 37.5% within this category)

In-Class Presentation (35% of total)

The in-class presentation is an opportunity for you to both show your work as well as see the variety of projects and solutions presented by your classmates. Presentations will be relatively short with just 10 minutes for each project. Plan on ~1 minute to set up the presentation and getting started, 5–7 minutes for your description and demonstration, leaving just 1–2 minutes for a question or two from the audience.

Grading criteria:

- (10%) Be practiced and polished — nervousness and mistakes are OK, but major hiccups reflect poorly

- (5%) Describe your project
- (5%) Say why your selected topic is important, or why it is meaningful to you
- (10%) Describe at least one major technical challenge and your solution
- (5%) Demonstrate your project

Recommended presentation format (e.g., 5-6 slides + demo):

- Title Slide – Name your project and your group
- Problem Statement – What is your project going to accomplish? Why is it important? Why does it interest you?
- Project Description – What does your project do and how does it address your problem/interest?
- Technical Challenge and Solution – What expected or unexpected challenges were there in implementing your project?
- Demonstration

Important: Attendance at all presentation sessions is mandatory without prior approval of absence. **Failure to attend all presentation sessions without prior approval will result in a 10% penalty to your grade.**

Written Report (40% of total)

The written report should be a 2–3 page document that describes your project as well as instructing any would-be users about how to execute your project. Much of the same information contained in your presentation should be present here as well. Feel free to use text from your project proposal, presentation, and code.

Each of the following points is worth 5%:

- (5%)The problem you are solving, or why your project interests you
- (5%)Your project's goals and all desired project functionality
- (5%)Does your project meet all the objectives given in your proposal? If not, what does not work and why?
- (5%)At least one but possibly more technical challenges and their solutions

- (5%) Detailed usage instructions — how to run your code, expected inputs/outputs, purpose of each script or function, example commands, and optionally screenshots
- (15%) Should include code scripts and functions necessary to run your project. Also include any supporting files (e.g., data files) necessary to run your code.
